Anthony Glulam Advantages

- Economical Beam & Header
- Architectural, Industrial & Framing Appearance
- One piece installation
- Flexibility in design & installation
- Cambered or non-cambered
- 2400F_b - 1.7E and 1.8E
- 3 1/8", 3 1/2", 5 1/8", 5 1/2", 6 3/4", 8 3/4" and 10 3/4" width
- Lighter than steel, LVL and PSL
- Certified Green Products
- Individually wrapped

Our Anthony Glulam is a glued laminated beam and header used where reliable engineered wood applications are required. It is an economical alternative to LVL and PSL for standard structural applications. Anthony's Glulam is available through wholesale stocking dealers and their retailers. Both 3 1/2" and 5 1/2" widths, which match 2x4 and 2x6 wall framing are available. The Anthony Glulam uses only locally available Southern pine lumber. Each piece is mechanically tested for strength and stiffness.

Each beam is manufactured with a specific lumber lay-up combination which optimizes Glulam performance and efficiency. The highest strength lumber is reserved for the outer laminations with the highest tensile and compressive stresses.

Our Anthony Glulam can be used for window, door and garage door headers, floor beams and roof ridge beams in both commercial and residential applications.

Features

Dimensional Stability:

Glulam is a laminated composite product of high-strength lumber. This randomizes any natural defects so there is greater beam strength and a higher degree of reliability. There is also less likelihood of warping, twisting, checking, cupping, or shrinking.

Moisture Control:

Anthony Glulam consistently averages 12% moisture, which is near equilibrium moisture content.

Building Code Evaluations:

Adopted under all major material building codes and the National Design Specification 2009/2012 (NDS). Anthony is a listee on APA's ICC ESR 1940 code report.

Fire Performance:

Glulam is classified as heavy timber and as such is suitable for IBC type IV construction. It has excellent resistance to fire.

Quality Assurance:

Glulam is manufactured in accordance with ANSI/A190.1 (Structural Glued Laminated Timber). Plant implemented Total Quality Management, statistical process control procedures, and APA – The Engineered Wood Association as our quality assurance program ensure consistent quality and performance in every Glulam.

Anthony Forest Products History

Anthony Forest Products Company (AFP), headquartered in El Dorado, Arkansas, has made some dramatic changes to position itself for the twenty-first century. The generations of forest products experience passed down through the family have made this vision possible.

When founded in 1916, the company was Anthony Brothers Lumber Company. The name of the company has changed, and the 4th generation of the Anthony Family has taken the reigns.

Now, Anthony Forest Products Company operates a southern pine lumber producing mill in Urbana, Arkansas and wood chip mills in Plain Dealing, Louisiana, and Troup, Texas. The company also operates an engineered wood laminating plant in El Dorado, a

laminating plant in Washington, Georgia, and a joint venture I-Joist plant, ANTHONY EACOM, Inc., in Sault Ste. Marie, Ontario, Canada.

The company's sawmill and the laminating plants have undergone massive modernization phases over the years. Both the El Dorado and Urbana sawmill have new state of the art MSR machines and the Urbana sawmill supplies over

80% of the MSR lam stock for the El Dorado laminating plant.

Not only has our sawmill diversified with changing markets, our laminating plants have diversified to create new products to meet customer demands.

New Design Values

The lowering of design values for visually graded Southern Yellow Pine lumber on June 1, 2013 opened up new opportunities for Anthony Power Products® like glulam. Shorter spans for dimension lumber and built up lumber headers and beams gave way to more stock glulam, Power Beam®, and PRG® glulam being used in the same house. Even though Southern Yellow Pine design values were reduced effecting lumber

spans, Anthony Forest Products glulam Power Products® were not affected by lower design values since special grading rules and MSR machines are in place to mechanically grade the lumber.

Certified by SFI

The Sustainable Forestry Initiative® (SFI) program is a comprehensive system of principles, objectives, and performance measures developed by professional foresters, conservationists and scientists, among others that combines the perpetual growing and harvesting of trees with the long term protection of wildlife, plants, soil and water quality. There are currently close to 240 million acres/100 million hectares of forestland in North America enrolled in the SFI® program, making it among the world's largest sustainable forestry programs.

Lion's Club Golf Course Club House

Anthony Power Products® Family

What's included in this brochure...

Anthony 2400F_b Glulam Allowable Load Tables

- Architectural, Industrial and Framing Appearance Grades
- Wide range of widths: 2 1/2 - 10 3/4", Depths: 3 1/2 - 28 7/8"

AFP 1.6E Short Span Header Allowable Load Tables

- Substitute for LSL and OSL
- Substitute for built-up lumber

Anthony Power Column® Allowable Load Tables

- High grade #1 dense SYP lumber (Combination #50)
- 3 1/8 - 8 3/4" widths, 4 1/8 - 9 5/8" depths (custom depths available)

Other Power Products® Family Literature available...

Power Joist®

- 2 1/2 and 3 1/2" flange widths
- Residential and commercial depths (9 1/2 - 24")

Anthony Power Beam®

- PSL and LVL Equivalent
- 3 1/2, 5 1/2 and 7" widths at I-Joist compatible depths

Power Rated Glulam (PRG®)

- I-Joist Compatible Depths (IJC)
- Substitute for LVL at lower cost
- Balanced, non-cambered beam

Power Preserved Glulam® Beams and Columns

- Cop-Guard® & Cop-8® treated glulam
- Two separate warranties for your protection

Southern Yellow Pine Lumber

- 2x4 - 2x12
- Grades: Machine Stress Rated Lumber (MSR), #1, #2, #3, #4, and export

Power Sizer® Software

- Sizes all Power Products® Family of engineered wood
- Free download single member sizer for all Anthony Engineered Wood Products including Power Column®

24F V4 1.7E IJC Framing Grade

Allowable Floor Load Tables LDF=1.00

Key - for each clear span there are three numbers:

Row 1: Maximum Total Load with LDF of 1.0, and deflection limited to L/240

Row 2: Maximum Live Load limited by deflection of L/360

Row 3: Required Bearing Length in trimmer thickness
(e.g., 1.5 = 1 trimmer, 3.0 = 2 trimmers, etc.)

These tables can be used to size simple span beams and headers that carry uniform loads. The PLF loads must be calculated and take into account all floor and roof framing loads coming onto the beam or header. Codes do allow live load reductions. See appropriate code sections.

24F V4 1.7E IJC Framing Grade

Allowable Roof Load Tables LDF=1.15

Key - for each clear span there are three numbers:

Row 1: Maximum Total Load with LDF of 1.15, and deflection limited to L/180

Row 2: Maximum Live Load limited by deflection of L/240

Row 3: Required Bearing Length in trimmer thickness
(e.g., 1.5 = 1 trimmer, 3.0 = 2 trimmers, etc.)

These tables can be used to size simple span beams and headers that carry uniform loads. The PLF loads must be calculated and take into account all floor and roof framing loads coming onto the beam or header. Codes do allow live load reductions. See appropriate code sections.

Allowable Loads for Anthony Glulam in Pounds per Linear Foot

24F V4 1.7E IJC Framing Grade

Allowable Roof Load Tables LDF=1.25

Key - for each clear span there are three numbers:

Row 1: Maximum Total Load with LDF of 1.25, and deflection limited to L/180

Row 2: Maximum Live Load limited by deflection of L/240

Row 3: Required Bearing Length in trimmer thickness
(e.g., 1.5 = 1 trimmer, 3.0 = 2 trimmers, etc.)

These tables can be used to size simple span beams and headers that carry uniform loads. The PLF loads must be calculated and take into account all floor and roof framing loads coming onto the beam or header. Codes do allow live load reductions. See appropriate code sections.

Allowable Roof Load Tables LDF=1.15

Key - for each clear span there are three numbers:

Row 1: Maximum Total Load with LDF of 1.15, and deflection limited to L/180

Row 2: Maximum Live Load limited by deflection of L/240

Row 3: Required Bearing Length in trimmer thickness
(e.g., 1.5 = 1 trimmer, 3.0 = 2 trimmers, etc.)

These tables can be used to size simple span beams and headers that carry uniform loads. The PLF loads must be calculated and take into account all floor and roof framing loads coming onto the beam or header. Codes do allow live load reductions. See appropriate code sections.

24F V4 1.7E Industrial Stock Glulam

Allowable Floor Load Tables LDF=1.00

Key - for each clear span there are three numbers:

Row 1: Maximum Total Load with LDF of 1.0, and deflection limited to L/240

Row 2: Maximum Live Load limited by deflection of L/360

Row 3: Required Bearing Length in trimmer thickness
(e.g., 1.5 = 1 trimmer, 3.0 = 2 trimmers, etc.)

These tables can be used to size simple span beams and headers that carry uniform loads. The PLF loads must be calculated and take into account all floor and roof framing loads coming onto the beam or header. Codes do allow live load reductions. See appropriate code sections.

24F V4 1.7E Industrial Stock Glulam

Allowable Roof Load Tables LDF=1.15

Key - for each clear span there are three numbers:

Row 1: Maximum Total Load with LDF of 1.15, and deflection limited to L/180

Row 2: Maximum Live Load limited by deflection of L/240

Row 3: Required Bearing Length in trimmer thickness
(e.g., 1.5 = 1 trimmer, 3.0 = 2 trimmers, etc.)

These tables can be used to size simple span beams and headers that carry uniform loads. The PLF loads must be calculated and take into account all floor and roof framing loads coming onto the beam or header. Codes do allow live load reductions. See appropriate code sections.

Allowable Loads for Anthony Glulam in Pounds per Linear Foot

24F V4 1.7E Industrial Stock Glulam

Allowable Roof Load Tables LDF=1.25

Key - for each clear span there are three numbers:

Row 1: Maximum Total Load with LDF of 1.25, and deflection limited to L/180

Row 2: Maximum Live Load limited by deflection of L/240

Row 3: Required Bearing Length in trimmer thickness
(e.g., 1.5 = 1 trimmer, 3.0 = 2 trimmers, etc.)

These tables can be used to size simple span beams and headers that carry uniform loads. The PLF loads must be calculated and take into account all floor and roof framing loads coming onto the beam or header. Codes do allow live load reductions. See appropriate code sections.

Allowable Loads for Anthony Glulam in Pounds per Linear Foot

24F V4 1.7E Industrial Stock Glulam

Allowable Floor Load Tables LDF=1.00

Key - for each clear span there are three numbers:

Row 1: Maximum Total Load with LDF of 1.0, and deflection limited to L/240

Row 2: Maximum Live Load limited by deflection of L/360

Row 3: Required Bearing Length in trimmer thickness
(e.g., 1.5 = 1 trimmer, 3.0 = 2 trimmers, etc.)

These tables can be used to size simple span beams and headers that carry uniform loads. The PLF loads must be calculated and take into account all floor and roof framing loads coming onto the beam or header. Codes do allow live load reductions. See appropriate code sections.

Allowable Loads for Anthony Glulam in Pounds per Linear Foot

Allowable Roof Load Tables LDF=1.15

Key - for each clear span there are three numbers:

Row 1: Maximum Total Load with LDF of 1.15, and deflection limited to L/180

Row 2: Maximum Live Load limited by deflection of L/240

Row 3: Required Bearing Length in trimmer thickness
(e.g., 1.5 = 1 trimmer, 3.0 = 2 trimmers, etc.)

These tables can be used to size simple span beams and headers that carry uniform loads. The PLF loads must be calculated and take into account all floor and roof framing loads coming onto the beam or header. Codes do allow live load reductions. See appropriate code sections.

24F V3 1.8E Architectural Stock Depth

Key - for each clear span there are three numbers:

Row 1: Maximum Total Load with LDF of 1.0, and deflection limited to L/240

Row 2: Maximum Live Load limited by deflection of $L/360$

Row 3: Required Bearing Length in trimmer thickness
(e.g., 1.5 = 1 trimmer, 3.0 = 2 trimmers, etc.)

These tables can be used to size simple span beams and headers that carry uniform loads. The PLF loads must be calculated and take into account all floor and roof framing loads coming onto the beam or header. Codes do allow live load reductions. See appropriate code sections.

Allowable Loads for Anthony Glulam in Pounds per Linear Foot

24F V3 1.8E Architectural Stock Depth Allowable Roof Load Tables LDF=1.15

Key - for each clear span there are three numbers:

Row 1: Maximum Total Load with LDF of 1.15, and deflection limited to L/180

Row 2: Maximum Live Load limited by deflection of L/240

Row 3: Required Bearing Length in trimmer thickness
(e.g., 1.5 = 1 trimmer, 3.0 = 2 trimmers, etc.)

These tables can be used to size simple span beams and headers that carry uniform loads. The PLF loads must be calculated and take into account all floor and roof framing loads coming onto the beam or header. Codes do allow live load reductions. See appropriate code sections.

Allowable Loads for Anthony Glulam in Pounds per Linear Foot

Single Span (ft)	3 1/8" Width								5 1/8" Width

24F V3 1.8E Architectural Stock Depth Allowable Roof Load Tables LDF=1.25

Key - for each clear span there are three numbers:

Row 1: Maximum Total Load with LDF of 1.25, and deflection limited to L/180

Row 2: Maximum Live Load limited by deflection of L/240

Row 3: Required Bearing Length in trimmer thickness
(e.g., 1.5 = 1 trimmer, 3.0 = 2 trimmers, etc.)

These tables can be used to size simple span beams and headers that carry uniform loads. The PLF loads must be calculated and take into account all floor and roof framing loads coming onto the beam or header. Codes do allow live load reductions. See appropriate code sections.

24F V3 1.8E Architectural Stock Depth

Allowable Roof Load Tables LDF=1.15

Key - for each clear span there are three numbers:

Row 1: Maximum Total Load with LDF of 1.15, and deflection limited to L/180

Row 2: Maximum Live Load limited by deflection of L/240

Row 3: Required Bearing Length in trimmer thickness
(e.g., 1.5 = 1 trimmer, 3.0 = 2 trimmers, etc.)

These tables can be used to size simple span beams and headers that carry uniform loads. The PLF loads must be calculated and take into account all floor and roof framing loads coming onto the beam or header. Codes do allow live load reductions. See appropriate code sections.

Allowable Loads for Anthony Glulam in Pounds per Linear Foot

24F V3 1.8E Architectural Stock Depth

Allowable Roof Load Tables LDF=1.25

Key - for each clear span there are three numbers:

Row 1: Maximum Total Load with LDF of 1.25, and deflection limited to L/180

Row 2: Maximum Live Load limited by deflection of L/240

Row 3: Required Bearing Length in trimmer thickness
(e.g., 1.5 = 1 trimmer, 3.0 = 2 trimmers, etc.)

These tables can be used to size simple span beams and headers that carry uniform loads. The PLF loads must be calculated and take into account all floor and roof framing loads coming onto the beam or header. Codes do allow live load reductions. See appropriate code sections.

Allowable Loads for Anthony Glulam in Pounds per Linear Foot

24F V3 1.8E Architectural Stock Depth Allowable Floor Load Tables LDF=1.00

Key - for each clear span there are three numbers:

Row 1: Maximum Total Load with LDF of 1.0, and deflection limited to L/240

Row 2: Maximum Live Load limited by deflection of L/360

Row 3: Required Bearing Length in trimmer thickness
(e.g., 1.5 = 1 trimmer, 3.0 = 2 trimmers, etc.)

These tables can be used to size simple span beams and headers that carry uniform loads. The PLF loads must be calculated and take into account all floor and roof framing loads coming onto the beam or header. Codes do allow live load reductions. See appropriate code sections.

Load Table Notations and Examples

Anthony Glulam Floor and Roof PLF Loading Notes

1. Values shown are the maximum uniform loads in pounds per linear foot (PLF) that can be applied to the beam. Beam weight has been subtracted from the total allowable load. Load tables are based on dry use conditions.
2. LDF = Load Duration Factor per code requirements
3. Bearing length shown is required at each end of header and is based on an allowable bearing stress of 740 psi for all tables except low stress header which is 650 psi. The beam must be sitting directly on top of 1 or more trimmers. A longer bearing length may be required depending on the material that the beam is bearing on. For example, if the beam is sitting on a SPF top plate, a longer bearing length will be required due to the lower compression perpendicular-to-grain design value for SPF.
4. The bearing lengths show the number of trimmers needed (e.g., 1.5 = 1 trimmer, 3.0 = 2 trimmers, etc.). This is based on the maximum PLF loads. Shorter bearing lengths may be used with lighter loads.
5. Tables are based on simple span conditions using the actual span as the center-to-center of bearing. Tables do not apply for continuous or multiple span conditions. The clear opening for the actual span given can be found by subtracting the listed bearing length from the actual span.
6. The beam is assumed to be loaded on the top edge and supported at bearing points. The beams should be laterally braced.
7. For deflection limits of L/240 and L/480, multiply The Maximum Live Load figure (Row 2) by 1.5 and 0.75, respectively. For deflection factors of L/180 and L/360, multiply the Maximum Live Load figure (row 2) by 1.333 and 0.667, respectively. The result shall not exceed the total load.

Procedures for Using Simple Span Beam Tables

1. To size beams from the Floor and Roof PLF Tables, it is required to have the following:
 - a. Live load determined by the governing Building Code
 - b. The dead load
 - c. The beam span or clear opening
 - d. Span carried or tributary width
2. These tables may be used to size a simple span uniformly distributed loaded beam or to determine the maximum load capacity of a specific size Glulam beam. The allowable loads shown in PLF tables include the beam weight. A simple span condition exists when the beam is supported on each end without overhangs. A continuous or cantilever loading application may require a balanced lay up and an engineering or design review.

Garage Door Header: Single Story Example Problem

Determine the header size for the conditions below:

Roof Load Conditions: Live (LL) = 30 psf
Dead (DL) = 10 psf

Building Width (B) = 24'

Overhang = 2'

Header Actual Span (L) = 17'

Formula:

Total Load = $(B/2 + 2') \times (LL + DL)$ = total applied load in PLF

Live Load = $(B/2 + 2') \times LL$ = total live load in PLF

Example:

Total Load = $(24/2 + 2) \times (30 + 10) = 560$ PLF

Live Load = $(24/2 + 2) \times 30 = 420$ PLF

- To size:**
1. Go to allowable roof load tables on page 7 titled 24F V4 1.7E IJC (LDF=1.15). Find the 17' actual span row.
 2. Using the top row, find a total load greater than 560 PLF (3.5 x 14)
 3. Using the middle row, find a live load greater than 420 PLF.

Beam to select: 3-1/2 x 14 - 17' 3" or 18' (bearing required = 3")

Notes:

1. Local code may require an engineered system of wall bracing for wall sections less than 4' in length adjacent to door openings. A glulam garage door header extended continuously over these shorter walls adjacent to the garage door opening is an integral part of these engineered systems.
2. If attic loading is anticipated, additional floor loading must be considered. Example: Add Floor LL=25, DL=10
Revised Total Load = 980 PLF, Live Load = 720 PLF (5 1/2 x 14 required)

Load Table Examples

Anthony Glulam Sizing Examples

Garage or Window Header: Two Story Example Problem

Determine the header size for the conditions below:

Roof Load Conditions:	Live (LL)	= 30 psf
	Dead (DL)	= 15 psf
	Total	= 45 psf
Floor Load Conditions:	Live (LL)	= 40 psf
	Dead (DL)	= 10 psf
	Total	= 50 psf

Calculate Total Load:

Roof Load	=	$(28/2 + 2) \times 45$	=	720 PLF
Floor Load	=	$(14/2) \times 50$	=	350 PLF
Wall Load	=	$8' \times 10 \text{ psf}$	=	80 PLF
Total Load			=	1150 PLF

Calculate Live Load :

Roof Load	=	$(28/2 + 2) \times 30$	=	480 PLF
Floor Load	=	$(14/2) \times 40$	=	280 PLF
Live Load			=	760 PLF

To Size:

- Go to 24F IJC Floor Load Table using LDF = 1.00 and 12' actual span row (page 6).
- Using top row, find total load equal to or greater than 1150 PLF. Pick the 3 1/2 x 16" since (1169 for 3 1/2 x 14") is less than 5%. It is safer to go up one size.
- Using middle row, find live load equal to or greater than 760 PLF. Total Load controlled, use 3 1/2 x 16" 24F IJC.
Beam to Select: 3-1/2 x 16 (3" Bearing required) or 5 1/2 x 14 (3" Bearing required)

24F V3 Architectural Floor Girder Beam Example Problem

Floor Load Conditions:	Live (LL)	= 40 psf
	Dead (DL)	= 12 psf
Building Width (B)		= 24'

Calculate Total Load:

Total Load	=	$(24/2) \times (40 + 12)$	=	624 plf
------------	---	---------------------------	---	---------

Calculate Live Load:

Live Load	=	$(24/2) \times 40$	=	480 plf
-----------	---	--------------------	---	---------

Beam to Select (Floor Load Table):

5-1/8 x 15 1/8 - 20'3" or 21' (Bearing Required 3")

24F V3 Architectural Simple Roof Rafter Example Problem

Determine the rafter size for the conditions below:

Roof Load Conditions:	Live (snow)	= 25 psf
	Dead	= 15 psf
Rafter Spacing:	5' on center	
Rafter Span:	20'	
Slope:	4/12	

Calculate Total Load:

Total Load	=	$5(25 + 15)$	=	200 plf
Live Load	=	$5(25)$	=	125 plf

Beam to Select (Roof 1.15 Table, Page 19):

3-1/8 x 11 (Bearing Required 1.5")

Note: If roof is greater than 4/12 pitch, dead load must be figured on total horizontal length of rafter.

Stick Frame Roof	2 x 4 Wall	Stick Frame Roof	Stick Frame Roof	Stick Frame Roof	Stick Frame Roof	Stick Frame Roof	Stick Frame Roof	Stick Frame Roof

Quick Beam Selection Guide

General Notes for Anthony Forest Products Beam Selection Table

Table is based on:

- Uniform loads
- Simple span only. Do not use table if joists are continuous span.
- Roof is stick framed with 1' -6" soffits. Load is 16 psf. LL & 10 psf. DL (non-snow @125%)
- Ceiling is uninhabitable attic without storage. Load is 10 psf. LL & 5 psf. DL.
- Floor loading is 40 psf. live load & 12 psf. dead load.
- Exterior wall weights of 80 plf., interior 60 plf.
- Deflection criteria of L/360 live load and L/240 total load.
- Beam Length is out to out of 2 x 4 walls, unless noted otherwise (see below).
- Bearing is 3 1/2" (except at 16'-9 & 18'-9 which is 3").

Beams are not designed to support brick load.

How to Use This Table

- Determine **House Width**.
- Locate **Beam Length**.
- Determine **Beam Location**.
- Select **Anthony Forest Products beam** width and depth.

AFP 1.6E Short Span Header (1500F_b - 175F_v - 650F_{c⊥})

FEATURES AND ADVANTAGES

- Built-up Lumber Substitute
- Full 3 1/2" Width - No Shimming
- Limited Lifetime Warranty
- Surface Sealed for Stability
- Perfect fit for wall panel headers
- One Piece Installation - Save \$\$
- Appearance Grade - Framing Grade
- Consistent Quality & Uniformity

Allowable Design Stresses and Properties (100% Load Duration)

Standard Depths (in.)	4 1/8	5 1/2	7	7 1/4	9 1/2	11 1/4	11 7/8
Weight (lbs/lineal ft.)	3.6	4.8	6.1	6.3	8.3	9.8	10.4
I (in ⁴)	20	49	100	111	250	415	488
Moment Capacity (lbs-ft)	1241	2206	3573	3833	6581	9229	10282
Shear Capacity (lbs)	1684	2246	2858	2960	3879	4594	4849

Design Values 1.6E Header

COMBINATION	AFP 1.6 HEADER
MOE	1.6 x 10 ⁶ psi
F _b	1500 psi
F _v	175 psi
F _{c⊥}	650 psi

Notes:

1. Header weight based on 36 pcf.
2. Moment Capacities are based on span up to 16'.
3. Volume factor adjustment not required for these beam sizes and spans.
4. Allowable design properties and load capacities are based on dry use conditions.

Notes: (Header Comparison Tables - Page 30)

* 1.30 LSL design values based upon 1700F_v, 1.30E, and 425F_v

**1.55E LSL design values based upon 2325F_v, 1.55E, and 310F_v

1. Values shown are the maximum uniform loads in pounds per lineal foot (PLF) which can be applied to the header. Header weight has been subtracted from the allowable total load (TL).
2. When no live load (LL) is given, total load (TL) controls.
3. Headers are assumed to be loaded on the top edge with continuous lateral support.

4. Bearing length shall be provided based upon F_c (perp) of 650 psi for AFP 1.6E SSH. The deeper depths at short spans will require bearings over 3".
5. The design span is assumed to be the clear opening plus 1/2 the required bearing length at each end.
6. Headers can be built-up with multiple plies of nominal 2" - thick lumber nailed together. Follow American Wood Council's details and a 1/2" wood structural panel filler is often used to make up the 3-1/2" wall width.

Power Column®

FEATURES

- Combination #50 (#1 Dense SYP)
- MOE = 1.9×10^6 psi
- $F_b = 2100-2300$ psi
- $F_{c\perp} = 1700-2300$ psi
- Architectural, Framing and Industrial Appearance Grades
- Individually Wrapped
- $3 \frac{1}{8}"$, $3 \frac{1}{2}"$, $5 \frac{1}{8}"$, $5 \frac{1}{2}"$, $6 \frac{3}{4}"$, $7"$ & $8 \frac{3}{4}"$ Widths
- Treated Columns Available

SERVICE AND SUPPORT

- National distribution through stocking dealers
- Comprehensive technical support literature and sizing software

Tomorrow's Engineered Wood - Today SM

Anthony Power Columns – Combination #50

Allowable Axial Loads (Pounds) for Combination No. 50 Glulam Columns

Side loads are not permitted. End loads are limited to a maximum eccentricity of either 1/6 column width or depth, whichever is worse.

Effective Column Length (ft)	Lamination Net Width = 3-1/8 in.											
	Net Depth = 4-1/8 in. (3 lams)			Net Depth = 5-1/2 in. (4 lams)			Net Depth = 6-7/8 in. (5 lams)			Net Depth = 8-1/4 in. (6 lams)

NOTES and Allowable Design Properties

- The tabulated allowable loads apply only to one-piece glulam members made with all N1D14 laminations (Combination 50) without special tension laminations.
- Applicable service conditions = dry
- The tabulated allowable loads are based on simply axially loaded columns subjected to a maximum eccentricity of either 1/6 column width or 1/6 column depth, whichever is worse. For side loads, other eccentric end loads, or other combined axial and flexural loads, see 2005 NDS
- The column is assumed to be unbraced, except at the column ends, and the effective column length is equal to the actual column length.
- Design properties for normal load duration and dry-use service conditions:
 Compression parallel to grain (F_c) = 2,300 psi for 4 or more lams, or 1,700 psi for 2 or 3 lams.
 Modulus of elasticity (E) = 1.9×10^6 psi
 Flexural stress when loaded parallel to wide faces of lamination (F_{bx})
 = 2,300 psi for 4 or more lams, or 2,100 psi for 3 lams.
 Flexural stress when loaded perpendicular to wide faces of lamination (F_{bys})
 = 2,100 psi for 2 lams to 15 in. deep without special tension laminations.
 Volume factor for F_{bys} is in accordance with 2009/2012 (NDS). Size factor for F_{by} is $(12/d)^{1/9}$, where d is equal to the lamination width in inches.

Connection Details

Common types of connectors and connection details are shown. The design values for most fasteners used with the Glulam are the same as those for solid timber and LVL. It must be noted that connections designed for specific applications may vary based on design loads and local code requirements. More information on connections can be found in APA "Glulam Connection Details" form No. T300H on our website, www.anthonyforest.com. Your local Glulam dealer can also provide connection detail literature and hardware.

Guidelines for Drilling Vertical and Horizontal Holes

VERTICAL HOLES

Whenever possible, avoid drilling vertical holes through glulam beams. As a rule of thumb, vertical holes drilled through the depth of a glulam beam cause a reduction in the capacity at the location directly proportional to the ratio of 1-1/2 times the diameter of the hole to the width of the beam. For example, a one inch hole drilled in a 6-inch-wide beam would reduce the capacity of the beam at that section by approximately $\frac{(1 \times 1\frac{1}{2})}{6} = 25\%$

For this reason, when it is necessary to drill vertical holes through a glulam member, the holes should be positioned in areas of the member that are stressed to less than 50 percent of design in bending. In a simply supported, uniformly loaded beam, this area would be located from the end of the beam inward approximately 1/8 of the beam span. In all cases, the minimum clear edge distance, as measured from either side of the member to the nearest edge of the vertical hole, should be 2-1/2 times the hole diameter. Use a drill guide to minimize “wandering” of the bit as it passes through knots or material of varying density, and to insure a true alignment of the hole through the depth of the beam.

HORIZONTAL HOLES

Like notches, holes in a glulam beam remove wood fiber, thus reducing the net area of the beam at the hole location and introducing stress concentrations. These effects cause a reduction in the capacity of the beam in the area of the penetration. For this reason, horizontal holes in glued laminated timbers are limited in size and location to maintain the structural integrity of the beam. Figure 3 shows the zones of a uniformly loaded, simply supported beam where the field drilling of holes may be considered. These non-critical zones are located in portions of the beam stressed to less than 50 percent of design bending stress and less than 50 percent of design shear stress. For beams of more complex loading or other than simple spans, similar diagrams may be developed.

ZONES WHERE SMALL HORIZONTAL HOLES ARE PERMITTED IN A UNIFORMLY LOADED, SIMPLY SUPPORTED BEAM

Field-drilled holes should be used for access only and should not be used as attachment points for brackets or other load bearing hardware unless specifically designed as such by the engineer or designer. Examples of access holes include those used for the passage wires, electrical conduit, small diameter sprinkler pipes, fiber optic cables, and other small, lightweight materials. These field drilled horizontal holes should meet the following guidelines:

- 1. Hole size:** The hole diameter should not exceed 1-1/2 inches or 1/10 the beam depth, whichever is smallest, with the exception of 1-inch-diameter or smaller holes as noted in Item 2 below.
- 2. Hole location:** The hole should have a minimum clear distance, as measured from the edge of the hole to the nearest of the beam, of 4 hole diameters to the top or bottom face of the beam and 8 hole diameters from the end of the beam. Note that the horizontal hole should not be drilled in the moment critical zone, as defined in the figure above, unless approved by an engineer or architect qualified in engineered timber design.

ZONES WHERE 1-INCH OR SMALLER DIAMETER HORIZONTAL HOLES ARE PERMITTED IN A UNIFORMLY LOADED SIMPLE OR MULTIPLE-SPAN BEAM ($d \geq 7\text{-}1/4$ INCHES)

- Zones where 1-inch or smaller diameter horizontal holes are permitted for passage of wire, conduit, etc.**
a) the maximum number of holes for each span shall not exceed 1 hole per 5 feet and b) the hole must not be cut in cantilevers.
 $\lambda = 6$ inches minimum when $\ell/d \geq 10$, or $\ell/6$ minimum when $\ell/d < 10$.

A 1-inch diameter or smaller hole may be cut at the middle half of the beam depth anywhere along the span, except for the area that is within 6 inches of the clear distance between the face of the support and the nearest edge of the hole, providing the following conditions are met:

- the beam is at least 7-1/4 inches in depth,
- the beam is subject to uniform loads only,
- the span-to-depth ratio (ℓ/d) is at least 10,
- the hole spacing and maximum number of holes must meet the requirements specified in Items 1 and 2 below, and
- the hole must not be cut in cantilevers.

If the depth-to-span ratio of the beam is less than 10, the 1-inch diameter of smaller hole may be cut in accordance with the provisions listed above except that the location of the hole must maintain a clear distance between the face of the support and the nearest edge of the hole of at least 1/6 of the span.

1. Hole Spacing: The minimum clear spacing between adjacent holes, as measured between the nearest edge of the holes, should be 8 hole diameters based on the largest diameter of any adjacent hole in the beam.

2. Number of holes: The maximum number of holes should not exceed 1 hole per 5 feet of beam length. In other words, the maximum number of holes should not exceed 4 for a 20-foot-long beam. The hole spacing limitation, as given above, should be satisfied separately.

For glulam members that have been oversized, the guidelines given above may be relaxed based on an engineering analysis.

Regardless of the hole location, holes drilled horizontally through a member should be positioned and sized with the understanding that the beam will deflect over a period of time under in-service loading conditions. This deflection could cause distress to supported equipment or piping unless properly considered.

Beam depth, d (in.)	Span when $\ell/d = 10$
7-1/4	6'-1"
7-1/2	6'-3"

Dimensional Tolerances

All Allowable Tolerances shown below are at time of manufacture per ANSI A190.1.

Width:

Plus or minus 1/16" of the specified width.

Depth:

Plus 1/8" per foot of depth. Minus 3/16" or 1/16" per foot of depth, whichever is larger.

Length:

Plus or minus 1/16" up to 20 feet. Plus or minus 1/16" per 20 feet of the specified length, except where length dimensions are not specified or critical.

Squareness:

The cross section of all glued laminated structural members shall be square within plus or minus 1/8" per foot of specified depth of the member, unless a specially shaped member is specified.

Camber:

The tolerances are applicable at the time of manufacture without allowance for dead load deflection. Plus or minus 1/4" up to 20 feet. Over 20 feet increase tolerance 1/8" per each additional 20 feet not to exceed 3/4".

Glulam Appearance Grades

Framing Appearance

- Laminations may possess the natural growth characteristics of the lumber grade.
- No voids or low laminations are filled.
- Members have a "Hit and Miss" (more miss) appearance.
- Glue smear is allowed.
- Most common widths are 3 1/2" and 5 1/2"

Industrial Appearance

- Laminations may possess the natural growth characteristics of the lumber grade.
- No voids or low laminations are filled.
- Members are surfaced in accordance with APA industrial finish standards.

Architectural Appearance

- Laminations may possess the natural growth characteristics of the lumber grade.
- Voids larger than 3/4" are filled with putty.
- Exposed faces are surfaced and low laminations are repaired.
- Exposed edges are eased.

Standard Radius or Curvature (feet)

Camber is the amount of bend or curvature which can be built into a Glulam to offset anticipated deflection or to compensate for dead load deflection. This is important for longer spans where other non-cambered engineered wood products may sag after loads are applied. Anthony Forest's standard radius is 2000'. Built-in camber will reduce ponding on flat roofs and eliminate unsightly appearance of deflection under load. Glulam is also offered non-cambered.

Camber Before Installation

Camber After Installation With Roof and Wall Loads Applied
Without camber, a beam or header may sag after loads are applied.

Find appropriate size selection table
(e.g., Garage Door, Floor Girder, etc.)

Find Applied Load Conditions (e.g., Live 20 psf, Dead 15 psf) and stress increase (e.g., 1.0 for floor load, 1.15 for roof snow load, 1.25 for roof construction load).

Find clear opening or column spacing that meets your conditions. If exact opening is not listed, use the next larger opening or column spacing.

Determine span of rafters or trusses framing into header

Double check your work to ensure you are using a table that meets or exceeds your loading conditions.

Is Camber Needed?
If the header or beam is greater than 20'-0", camber may be desired.

Find Glulam size from Anthony Size Selection Tables or Anthony Power Sizer® Software.

We encourage you to compare cost with other products, such as LVL and PSL

Camber is the amount of bend or curvature which can be built into a Glulam beam to offset anticipated deflection or to compensate for dead load deflection.

Example: a 2000' Anthony Glulam beam at 12' allows 1/8" camber

	LENGTH

	2 1/2"	2 3/4"						

Engineered Timbers

...offer versatility, economy, strength, and durability

Versatility

Anthony glued laminated timber has a proven track record of reliability for a variety of structural applications. Exposed beams offer a dramatic design element, yet provide an unusual sense of softness, natural charm, and inviting warmth.

At the same time, engineered timber construction provides an exceptionally high level of safety, durability, and cost efficiency. Kiln-dried Anthony Glulam offers a strong, workable long span performance capability unmatched by any other building material.

Cost Effective/Energy Efficient

Anthony Glulam is surprisingly economical as compared to the higher cost composites or steel. Glulam has a high strength to weight ratio and is sized to fit all system-type framing applications. One piece construction reduces building time and cost, and Glulam can be trimmed to fit on the job site.

The energy efficiency of engineered timber can provide additional savings to the property owner. The natural thermal and insulating qualities of laminated wood can be combined with thermally efficient insulation materials to keep heat loss at a minimum.

Strong, Durable, Fire Safe, and Stable

Throughout history, wood has been a durable building material, assuming proper principles of design, construction, and maintenance are followed. Anthony Glulam provides an even higher degree of proven quality manufacturing.

Both the 2400F and 3000F Power Beam exhibit property characteristics superior to solid sawn wood. Extra precautions are taken to ensure all laminations are kiln-dried to a maximum 15% moisture content. The end product results in a beam member with an exceptional level of dimensional stability, virtually eliminating checking, twisting, warping, and shrinkage.

High resilience allows Glulam to absorb shocks that could rupture alternative building materials like concrete or steel. Glulam is also ideal for use in areas subject to high winds or earthquake damage. Glulam has excellent fire-resistive qualities. The performance of Glulam under fire conditions is markedly superior to most unprotected non-combustible materials.

Readily Available

Anthony Glulam is readily available through a network of stocking distributors throughout the country. Glulam is offered in specified lengths up to 60' in industrial, architectural, and framing grades. All beams are either bundled or individually wrapped with water-resistant paper. Beams are squared-end trimmed and manufactured with camber or no-camber. Beams are wax sealed for improved protection.

Computer Software

Anthony Forest offers a Power Sizer® software for fast and accurate sizing of most beam applications.

Handling and Storage

Anthony Glulam should be stored and handled in accordance with the following guidelines to maximize performance and to minimize necessary field adjustments.

- Protect the glulam products from direct exposure to weather conditions (i.e. sun, wind, rain, snow) by storing under cover or by leaving the paper wrap intact until they are installed in place.
- Store on stickers or racks above ground moisture and in orderly stacks at heights that may be handled safely.
- Use care in moving and storing with forklifts to prevent damage with forks.
- To minimize checking, seal ends of beams after trimming or cutting.
- Do not install damaged glulam. Notify Anthony Forest Products Company or your local distributor for assistance.
- Once beams are installed, remove protective wrap. Allow them to gradually season and adjust to the temperature and moisture conditions of the structure.
- Do not directly expose glulam members to rapid changes in moisture and temperature, typical of temporary heating units. Such exposure may result in excessive surface checking.

In the field glulam is subject to humidity and moisture that can affect critical size tolerance and appearance. To maintain the dimensional stability and minimize checking of beams, each beam is surface sealed with a special protective wax emulsion coating for wood.

Our sealers are environmentally friendly, water-based products that help to stabilize the moisture content of wood. Not only does the seal protect the glulams from environmental moisture, but it allows the glulam to adjust to the environment slowly.
